

CASE STUDY

O'Donnell's Civil Engineers

Background

O'Donnell's Civil Engineers are a civil engineering contractor working primarily on ground works associated with the first phases of construction work which includes construction of roads, sewers and excavation of foundations. O'Donnell's engaged Callidus as their retained competent person for health and safety to enable them to use our specialist advice as and when they needed it.

Solution

In the early stages of our appointment, we spent some time getting to know our client and understanding the key risks and challenges they face as a contractor working in a high-risk environment. We then developed a tailored approach to our service delivery, focusing on proactive construction site inspections by specialist consultants experienced in civil engineering. We also provided assistance with health and safety documentation to enable our client to focus on doing what they do best.

Outcomes

We provide bespoke technical health and safety advice whenever it is needed and also carry out regular formal site inspections, which enabled O'Donnell's to effectively demonstrate to their clients that they engage in regular proactive monitoring of their site activities. This provides assurance that a high-risk element of site construction works is being managed well.

What We Transformed

Health and safety competent person support in place for assistance when required at the fraction of the cost of a full-time directly employed equivalent.

Technical site health and safety inspections carried out on a monthly basis to demonstrate effective proactive monitoring and action close out.

Assistance provided in submission of industry health and safety accreditations (CHAS).
